"Virtually" Concatenating NetCDF Files, using cdscan

Here we show how to concatenate NetCDF files without rewriting any data, simply creating a new "virtual" control file
This is to be executed outside of python, before runnig a script.
We are assuming your python resides in /usr/local/cdat.

```
cdscan -x u.xml /usr/local/cdat/sample_data/u_*.nc
```

The newly genrated file: u.xml can now be accessed by python scripts and contains all the years spanned by u in files u_xxxx.nc
